European Patent Office International Preliminary Examining Authority Erhardstrasse 27 D-80298 Munich GERMANY PCT Chapter II MU DG 2

Attention:

Pa I Soto, R.

Authorized Officer/Examiner

Dear Sirs:

Re:

International Application PCT/CA00/00762

Title:

LPL VARIANT THERAPEUTICS

Applicant:

THE UNIVERSITY OF BRITISH COLUMBIA et al.

Int'l Filing Date:

23 June 2000

Priority Date:

24 June 1999

This is in response to the Written Opinion dated 29 March 2001, and further to our letters of 22 June and 13 July 2001.

REMARKS

The Examiner has acknowledged that claims 1-33 define subject matter that is new, in accordance with the requirement of Art. 33(2) PCT. The Examiner has objected to the claims as lacking an inventive step, on the basis of D1 and D2 in combination.

The test for establishing inventive step is whether the prior art demonstrates that there was a reasonable expectation of success in making and using the claimed

VMS.

invention. This test has for example been set out by the EPO Board of Appeal in T 296-93, "HBV antigen production/ BIOGEN", EP- B1 182 442 (not yet published in the OJ EPO), as follows:

"The fact that other persons (or teams) were also working on the same project might suggest that it was 'obvious to try' or that it was 'an interesting area to explore', but it does not necessarily imply that there was "a reasonable expectation of success". "A reasonable expectation of success", which should not be confused with the understandable "hope to succeed", implies the ability of the skilled person to reasonably predict, on the basis of the existing knowledge before the starting of a research project, a successful conclusion to the said project within acceptable time limits. The more unexplored a technical field of research is, the more difficult is the making of predictions about its successful conclusion and, consequently, the lower the expectation of success."

In the present case, the demonstration in the present application that the administration of an LPL S447X therapeutic produces a therapeutically relevant response in vivo (see Examples 1 and 2 of the present application) represents a significant breakthrough in this area of research, for which there was no reasonable expectation of success in view of the cited references or other prior art. The prior art (particularly D2) merely reports an association between the LPL S447X allele and certain disease outcomes, it does not serve as a sufficient basis for a reasonable expectation of success through the use of an LPL S447X therapeutic. The Applicants respectfully submit that the physiology of cardiovascular disease and lipid metabolism is sufficiently complex that one could not have known with any degree of certainty what the effect would be of administering an LPL S447X therapeutic to an animal, prior to the discoveries reported in the present application demonstrating the in vivo effects of such therapeutics.

The extent to which the present results were <u>not</u> predictable is for example shown by the cited art itself. In particular, **D2** discloses that post-heparin LPL relationships to lipids and lipoproteins were not altered by apo E genotypes, whereas **D1** indicates that apo E is one of the alternative proteins that may be used in the treatment of

cardiovascular disease (see D2 Abstract and D1, page 9, lines 29-36). Irrespective of whether apo E therapeutics may be effective or not, this demonstrates the considerable amount of uncertainty regarding the actual therapeutic effect of any one component involved in regulating the complex balance of plasma lipids and lipoproteins in cardiovascular disease. D1 and D2 in combination therefore reinforce the general teaching in the art that there can be no **reasonable expectation of success** in modulating-physiological conditions relevant to cardiovascular disease, in the absence of experimental evidence such as is provided in the present application showing that a particular therapeutic can actually be effective *in vivo*. Examples 1 and 2 in the present application provide, for the first time, *in vivo* evidence of the surprising effects of LPL S447X therapeutics. The degree of unpredictability of this result is reinforced by the surprisingly different results reported for the LPL S447X therapeutics compared to the wild type LPL protein controls in these Examples.

The present application reports the surprising result that the LPL S447X therapeutics of the invention may be used to provide an increase in LPL protein mass in post-heparin plasma *in vivo*. This is a result which must be the consequence of a complex and multifaceted interaction between the LPL S447X therapeutic and a wide variety of factors that together help to regulate this physiological outcome which is relevant to cardiovascular disease. Any number of endogenous regulatory mechanisms could have been engaged by the administration of the LPL S447X therapeutic to prevent this result from occurring. Even with the teaching of D1 and D2, one skilled in the art could not have had a **reasonable expectation** that a LPL S447X therapeutic would **successfully** modulate LPL protein mass in post-heparin plasma, and could not therefore have had a reasonable expectation of success with the presently claimed invention. The only reasonable basis for such an expectation is the experimental evidence presented in the application.

In view of the foregoing submissions, Applicants respectfully submit that the claimed invention is novel, involves an inventive step and is industrially applicable. Applicant requests that any remaining reservations that the examiner may have should be discussed with the undersigned in a personal interview, under Rule 66.6, or be made the

subject of an additional Written Opinion to which the applicant may respond under Rule 66.4.

Respectfully submitted,

SMART & BIGGAR

VIII. Certain observations on the international application

The following observations on the clarity of the claims, description, and drawings or on the question whether the claims are fully supported by the description, are made: see separate sheet

R Item III

Non-establishment of opinion with regard to novelty, inventive step and industrial applicability

- Claims 11-20 relate to subject-matter considered by this Authority to be covered by 1. the provisions of Rule 67.1(iv) PCT. Consequently, no opinion will be formulated with respect to the industrial applicability of the subject-matter of these claims (Article 34(4)(a)(i) PCT).
- 2. Present claim 34 does not meet the requirements of Art. 6 because it does not define the matter for which protection is sought. This should be achieved in terms of technical features and not by references to the description and/or the drawings. Furthermore, according to Rule 6.2(a) PCT, claims should not contain such references except where absolutely necessary, which is not the case here. No opinion has been established with respect to novelty, inventive step and industrial applicability of said claim.

Re Item V

Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

- 3. Reference is made to the following documents:
 - D1: WO 95 27512 A (BAYLOR COLLEGE MEDICINE) 19 October 1995,
 - D2: HENDERSON H. E. ET AL: 'Lipoprotein lipase activity is decreased in a large cohort of patients with coronary artery disease and is associated with changes in lipids and lipoproteins.' JOURNAL OF LIPID RESEARCH, vol. 40, no. 4, April 1999, pages 735-743, and
 - D3: FISHER R. M. ET AL: 'Common variation in the lipoprotein lipase gene: Effects on plasma lipids and risk of atherosclerosis.' ATHEROSCLEROSIS, vol. 135, no. 2, December 1997, pages 145-159.
- 4. The present application relates to (i) the use of an LPL S447X therapeutic for the preparation of a pharmaceutical composition for the treatment of an LPL-responsive

condition in a subject (claim 1); (ii) a method of treating a disease in a subject, comprising administering to the subject an effective amount of an LPL S447X therapeutic, wherein the disease is an LPL-responsive disease (claim 11); (iii) an LPL S447X therapeutic for use as an active pharmaceutical substance wherein the LPL S447X therapeutic is an LPL S447X protein, as specified in claim 21, or an LPL S447X nucleic acid encoding said LPL S447 X protein; and (iv) a gene therapy vector comprising an LPL S447X therapeutic as specified before (claim 28).

- The present application satisfies the requirements of Art. 33(2) PCT because th 5. subject-matter of claims 1-33 is new. None of the documents cited in the International search report discloses all the technical features of the independent claims of the present application.
- The present application does also meet the requirements of Art. 33(3) PCT because 6. the subject-matter of claims 1-33 involves an inventive step.

D1 (see paragraph linking pages 9 and 10, lines 20-26 on page 11, example 11 and claims 24-25), which is regarded as the closest prior art, discloses a method of gene therapy for the treatment of cardiovascular disease based in the overexpression of lipoprotein lipase (LPL). The present application differs from D1 in that the therapeutic agent is LPL S447X instead of the wild type LPL. The use of LPL S447X provides advantageous results as compared to the wild type LPL.

The problem to be solved by the present application is regarded in the provision of a more effective gene therapy than that disclosed in D1 for the treatment of cardiovascular disease and other conditions requiring an elevation of LPL levels.

The solution provided by the present application is considered as involving an inventive step for the following reasons. D2 (see the abstract and right column on page 741) discloses that the S447X gene variant is associated with an increase in LPL activity when compared to the wild type LPL. D3 (see section 5.3.) reports that the S447X mutation is associated with a beneficial lipid profile with lower TG concentrations and protection against CAD. It also reports in vitro studies suggesting that the increase in post-heparin LPL activity is due to a higher production of LPL-S447X. These indications would probably prompt the skilled person to try a

EXAMINATION REPORT - SEPARATE SHEET

modification of the solution disclosed in D1 in the way proposed in the present application in order to solve the problem posed. However, it is considered that the physiology of cardiovascular disease and lipid metabolism is sufficiently complex to have predicted, prior to the discoveries reported in the present application, what the effect would have been of administering an LPL S447X therapeutic in connection with cardiovascular disease and LPL-responsive conditions, in general. Thus, the reports in the prior art do not serve as a sufficient basis for a reasonable expectation of success through the use of an LPL S447X therapeutic.

- For the assessment of the present claims 1-27 on the question whether they are 7. industrially applicable, no unified criteria exist in the PCT Contracting States. The patentability can also be dependent upon the formulation of the claims. The EPO, for example, does not recognize as industrially applicable the subject-matter of claims to the use of a compound in medical treatment (present claims 11-20), but may allow, however, claims to a known compound for first use in medical treatment and the use of such a compound for the manufacture of a medicament for a new medical treatment.
- Claims 28-33 meet the criterion set forth in Article 33(4) PCT because their subject-8. matter is susceptible of industrial application.

Re Item VIII

C rtain observations on the international application

- The technical features of present claims 5-6, 15-16, 23-24 and 30-31 are not 9. mentioned in the description as required by Art. 6 PCT (see the Guidelines CIII, 6.6.).
- 10. Present claims 3, 7, 13, 17, 21, 25, 28 and 32, as well as those claims depending or relating to them, do not meet the requirements of Art. 6 PCT in that the matter for which protection is sought is not clearly defined. The reason is that said claims include in their formulation the expression "contiguous segment", which has no recognised meaning in the art, whereby the corresponding LPL S447 protein is not clearly defined.

INTERNATIONAL PRELIMINARY

International application No. PCT/CA00/00762

EXAMINATION REPORT - SEPARATE SHEET

11. Present claims 6, 16, 24 and 31 also fail to clearly define the matter for which protection is sought because the expression "stringent conditions" is vague and has not recognised meaning in the art. Thus, said claims do also not meet th requirements of Art. 6 PCT.

Priority date (day/month/year) 24/06/1999

23/06/2000

Applicant

THE UNIVERSITY OF BRITISH COLUMBIA et al.

- 1. The applicant is hereby notified that this International Preliminary Examining Authority transmits herewith the international preliminary examination report and its annexes, if any, established on the international application.
- 2. A copy of the report and its annexes, if any, is being transmitted to the International Bureau for communication
- 3. Where required by any of the elected Offices, the International Bureau will prepare an English translation of the report (but not of any annexes) and will transmit such translation to those Offices.

4. REMINDER

The applicant must enter the national phase before each elected Office by performing certain acts (filing translations and paying national fees) within 30 months from the priority date (or later in some Offices) (Article 39(1)) (see also the reminder sent by the International Bureau with Form PCT/IB/301).

Where a translation of the international application must be furnished to an elected Office, that translation must contain a translation of any annexes to the international preliminary examination report. It is the applicant's responsibility to prepare and furnish such translation directly to each elected Office concerned.

For further details on the applicable time limits and requirements of the elected Offices, see Volume II of the

VIII. Certain observations on the international application

The following observations on the clarity of the claims, description, and drawings or on the question whether the claims are fully supported by the description, are made: see separate sheet

Re Item III

Non-establishment of opinion with regard to novelty, inventive step and industrial applicability

- Claims 11-20 relate to subject-matter considered by this Authority to be covered by . 1. the provisions of Rule 67.1(iv) PCT. Consequently, no opinion will be formulated with respect to the industrial applicability of the subject-matter of these claims (Article 34(4)(a)(i) PCT).
 - Present claim 34 does not meet the requirements of Art. 6 because it does not define 2. the matter for which protection is sought. This should be achieved in terms of technical features and not by references to the description and/or the drawings. Furthermore, according to Rule 6.2(a) PCT, claims should not contain such references except where absolutely necessary, which is not the case here. No opinion has been established with respect to novelty, inventive step and industrial applicability of said claim.

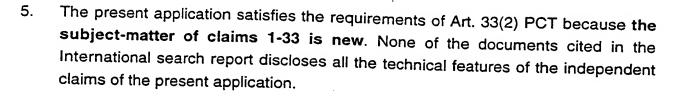

Re Item V

Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

- Reference is made to the following documents: 3.
 - D1: WO 95 27512 A (BAYLOR COLLEGE MEDICINE) 19 October 1995,
 - D2: HENDERSON H. E. ET AL: 'Lipoprotein lipase activity is decreased in a large cohort of patients with coronary artery disease and is associated with changes in lipids and lipoproteins.' JOURNAL OF LIPID RESEARCH, vol. 40, no. 4, April 1999, pages 735-743, and
 - D3: FISHER R. M. ET AL: 'Common variation in the lipoprotein lipase gene: Effects on plasma lipids and risk of atherosclerosis.' ATHEROSCLEROSIS, vol. 135, no. 2, December 1997, pages 145-159.
- The present application relates to (i) the use of an LPL S447X therapeutic for the 4. preparation of a pharmaceutical composition for the treatment of an LPL-responsive

EXAMINATION REPORT - SEPARATE SHEET

condition in a subject (claim 1); (ii) a method of treating a disease in a subject, comprising administering to the subject an effective amount of an LPL S447X therapeutic, wherein the disease is an LPL-responsive disease (claim 11); (iii) an LPL S447X therapeutic for use as an active pharmaceutical substance wherein the LPL S447X therapeutic is an LPL S447X protein, as specified in claim 21, or an LPL S447X nucleic acid encoding said LPL S447 X protein; and (iv) a gene therapy vector comprising an LPL S447X therapeutic as specified before (claim 28).

The present application does also meet the requirements of Art. 33(3) PCT because 6. the subject-matter of claims 1-33 involves an inventive step.

D1 (see paragraph linking pages 9 and 10, lines 20-26 on page 11, example 11 and claims 24-25), which is regarded as the closest prior art, discloses a method of gene therapy for the treatment of cardiovascular disease based in the overexpression of lipoprotein lipase (LPL). The present application differs from D1 in that the therapeutic agent is LPL S447X instead of the wild type LPL. The use of LPL S447X provides advantageous results as compared to the wild type LPL.

The problem to be solved by the present application is regarded in the provision of a more effective gene therapy than that disclosed in D1 for the treatment of cardiovascular disease and other conditions requiring an elevation of LPL levels.

The solution provided by the present application is considered as involving an inventive step for the following reasons. D2 (see the abstract and right column on page 741) discloses that the S447X gene variant is associated with an increase in LPL activity when compared to the wild type LPL. D3 (see section 5.3.) reports that the S447X mutation is associated with a beneficial lipid profile with lower TG concentrations and protection against CAD. It also reports in vitro studies suggesting that the increase in post-heparin LPL activity is due to a higher production of LPL-S447X. These indications would probably prompt the skilled person to try a

modification of the solution disclosed in D1 in the way proposed in the present application in order to solve the problem posed. However, it is considered that the physiology of cardiovascular disease and lipid metabolism is sufficiently complex to have predicted, prior to the discoveries reported in the present application, what the effect would have been of administering an LPL S447X therapeutic in connection with cardiovascular disease and LPL-responsive conditions, in general. Thus, the reports in the prior art do not serve as a sufficient basis for a reasonable expectation of success through the use of an LPL S447X therapeutic.

- 7. For the assessment of the present claims 1-27 on the question whether they are industrially applicable, no unified criteria exist in the PCT Contracting States. The patentability can also be dependent upon the formulation of the claims. The EPO, for example, does not recognize as industrially applicable the subject-matter of claims to the use of a compound in medical treatment (present claims 11-20), but may allow, however, claims to a known compound for first use in medical treatment and the use of such a compound for the manufacture of a medicament for a new medical treatment.
- 8. Claims 28-33 meet the criterion set forth in Article 33(4) PCT because their subject-matter is susceptible of industrial application.

Re Item VIII

Certain observations on the international application

- 9. The technical features of present claims 5-6, 15-16, 23-24 and 30-31 are not mentioned in the description as required by Art. 6 PCT (see the Guidelines CIII, 6.6.).
- 10. Present claims 3, 7, 13, 17, 21, 25, 28 and 32, as well as those claims depending or relating to them, do not meet the requirements of Art. 6 PCT in that the matter for which protection is sought is not clearly defined. The reason is that said claims include in their formulation the expression "contiguous segment", which has no recognised meaning in the art, whereby the corresponding LPL S447 protein is not clearly defined.

11. Present claims 6, 16, 24 and 31 also fail to clearly define the matter for which protection is sought because the expression "stringent conditions" is vague and has not recognised meaning in the art. Thus, said claims do also not meet the requirements of Art. 6 PCT.
